Description <p>HardenedBSD comes with its own updating system, hbsd-update-build. There are sophisticated publishing scripts available on GitHub for automagically building and publishing HardenedBSD builds that can be installed using hbsd-update and verified using DNSSEC.</p> <p>My goal of this hackathon is to give those updating scripts much-needed TLC and produce a howto that allows developers to build their own HBSD builds and config files for distributing them using hbsd-update.</p> <p>Deliverables:</p> <ul style="list-style-type: none">- pull requests to hbsd-update-build if necessary- pull requests to update-publisher if necessary- How To documentation on https://xmj.github.io/articles/sysadmin/			

History

#1 - 12/02/2018 01:19 PM - Johannes Meixner
